Like the reviewers, I like your manuscript very much. I will not repeat their concerns here. They are relatively minor, and I think you can address them in a revision.

I actually have nothing to add above the points they made. I only have a minor comment. I recommend not making researchers the subjects of your sentences. Put them in parentheses at the end of sentences. Research findings and theories should be the subjects of your sentences, rather than the people who did the research or proposed the theory.

Thus, I am conditionally accepting your manuscript for publication. The condition is that you address the concerns raised by the reviewers. I will send your manuscript back to them. All have agreed to review a revised revision.

“an observation which deviates so much from other observations as to cause suspicions that it was generated by a different mechanism.”

(Hawkins, 1980)

“an observation which deviates so much from other observations *as to cause suspicions that it was generated by a different mechanism.*”

(Hawkins, 1980)

“an observation which **deviates** so much from other observations as to cause suspicions that it was generated by a different mechanism.”

(Hawkins, 1980)

Based on this sample, how much
would you say a single course
book costs, on average?

214 participants
1070 predictions

analytic approach

Robust Regression

as a linear mixed-model with random participant intercepts

analytic approach

Robust Regression

as a linear mixed-model with random participant intercepts

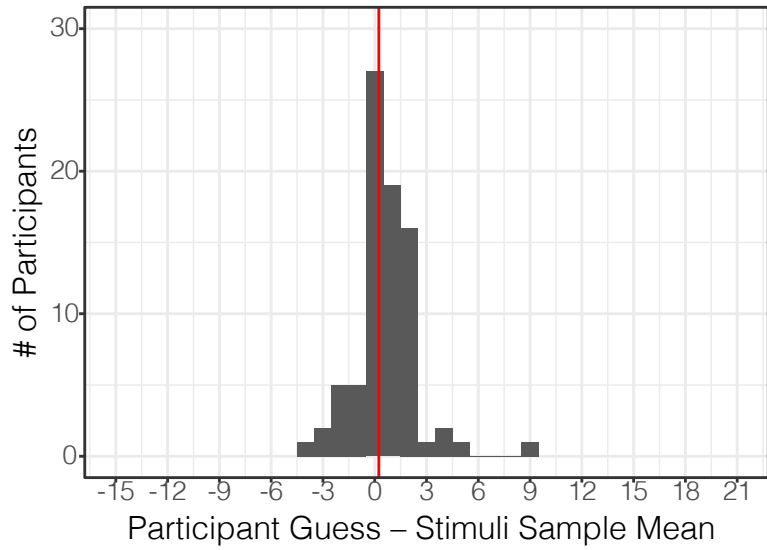

Quantile Regression

with bootstrapped SEs clustered by participant

predicting the 10th, 50th and 90th percentiles

Latest Train is 12 minutes

results

Evaluate participants against 4 predictions:

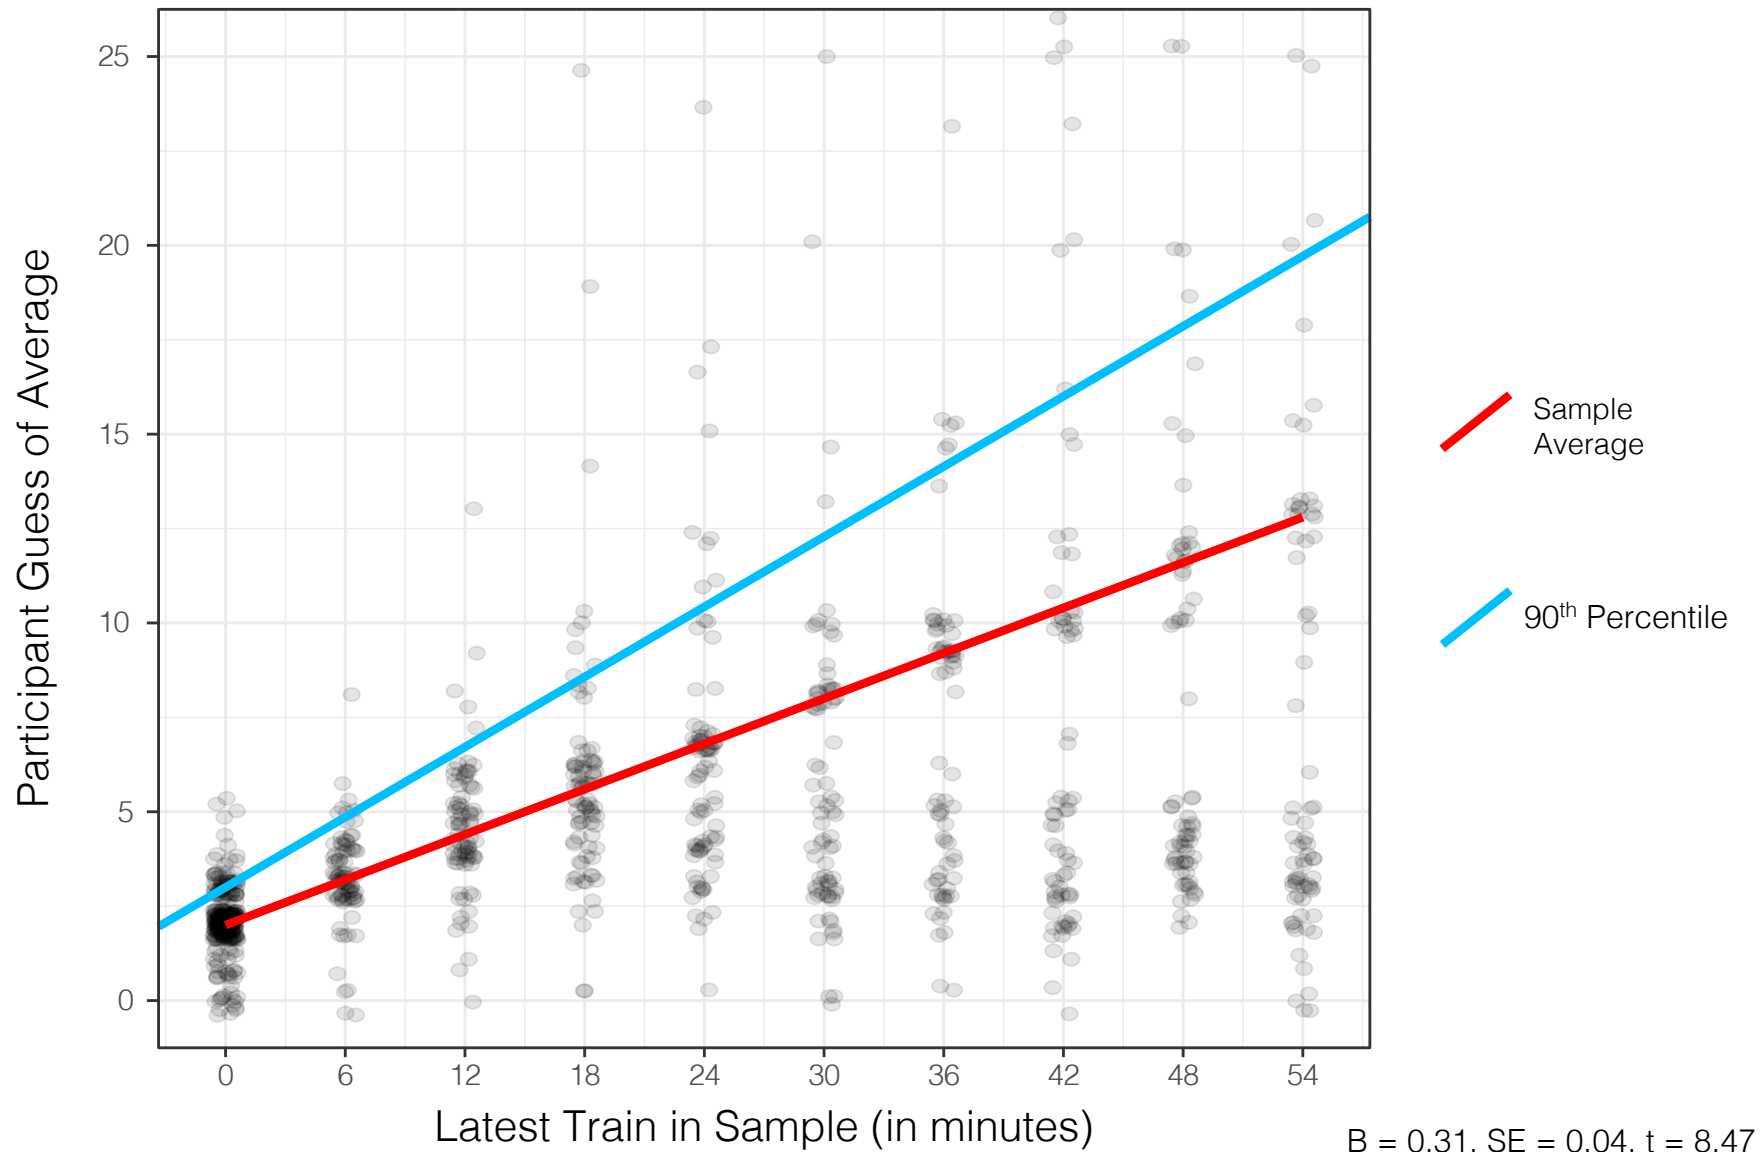

1. Overweighting
2. Sample mean
3. Discordancy tests
4. Sample median

Is there evidence of giving outliers extra weight?

Is there evidence of giving outliers extra weight?

Is there evidence of giving outliers extra weight?

Do participants use the sample mean to predict population mean?

Do participants use the sample mean to predict population mean?

When do participants (on average) start to discount outliers?

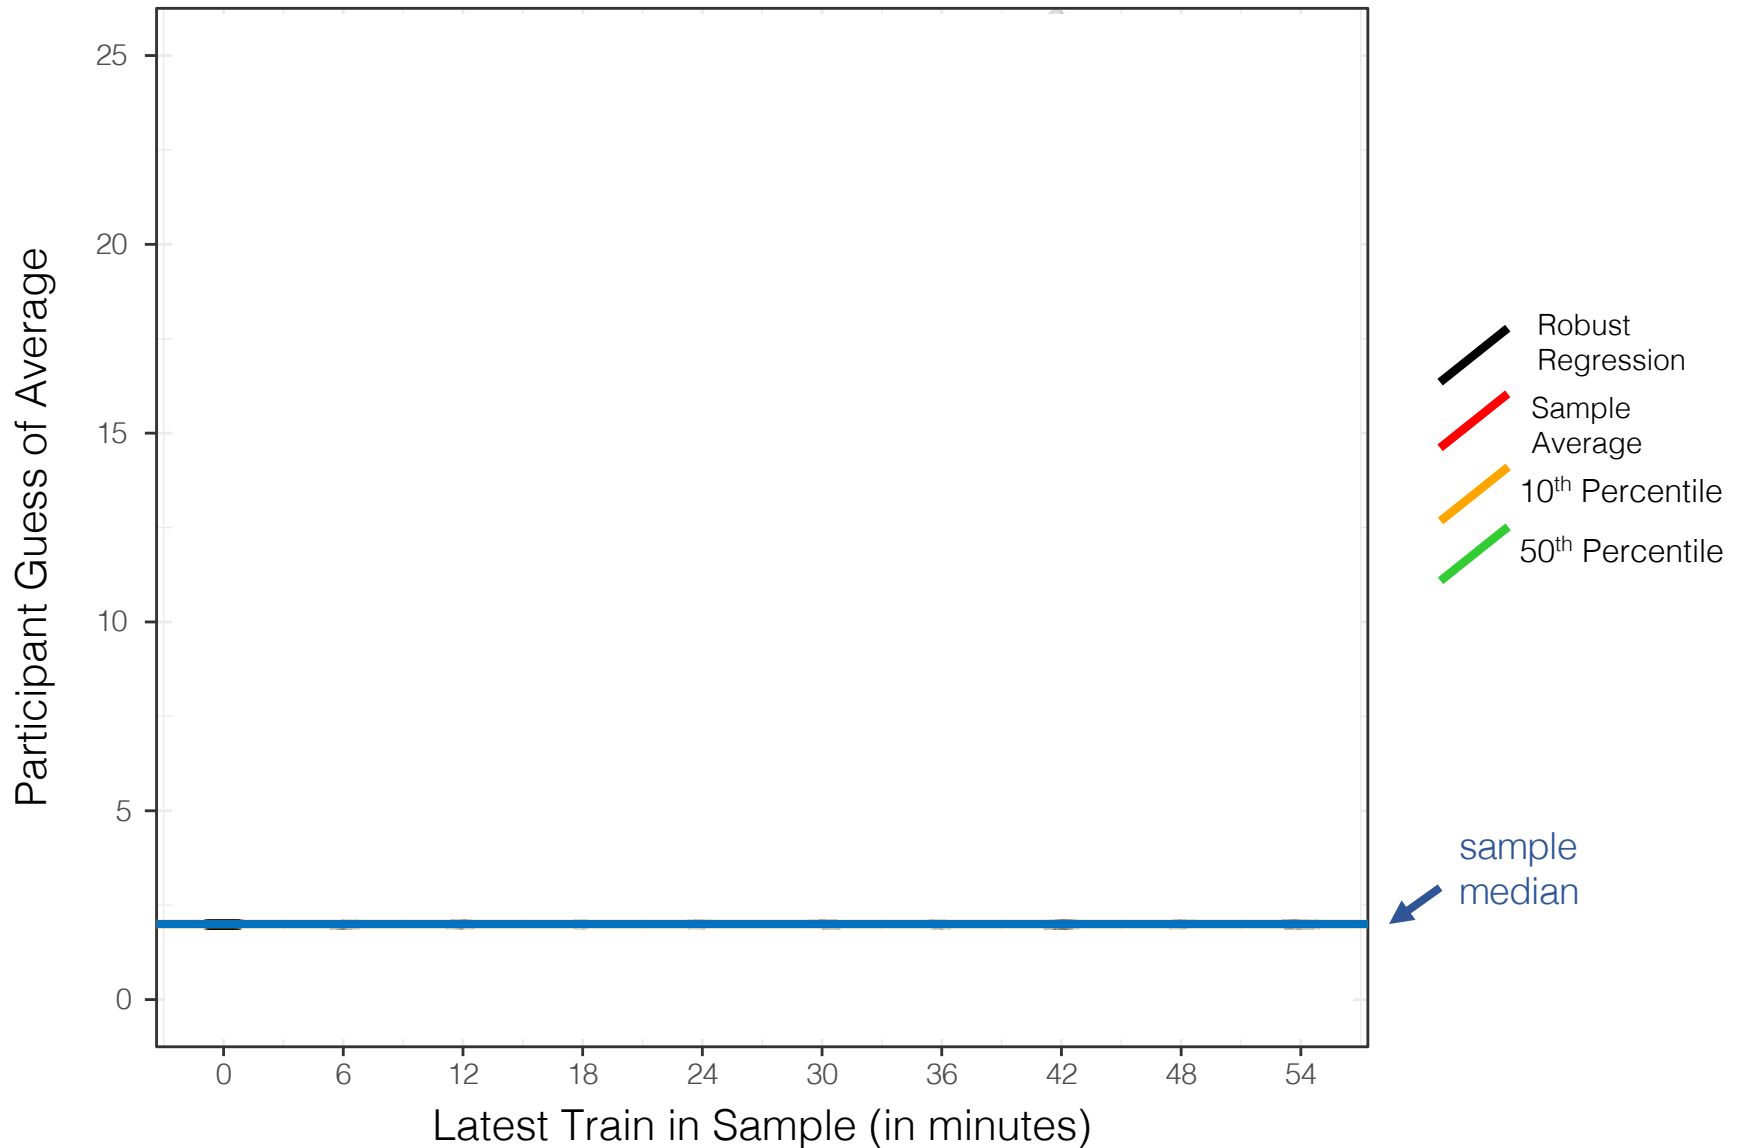

When do participants (on average) start to discount outliers?

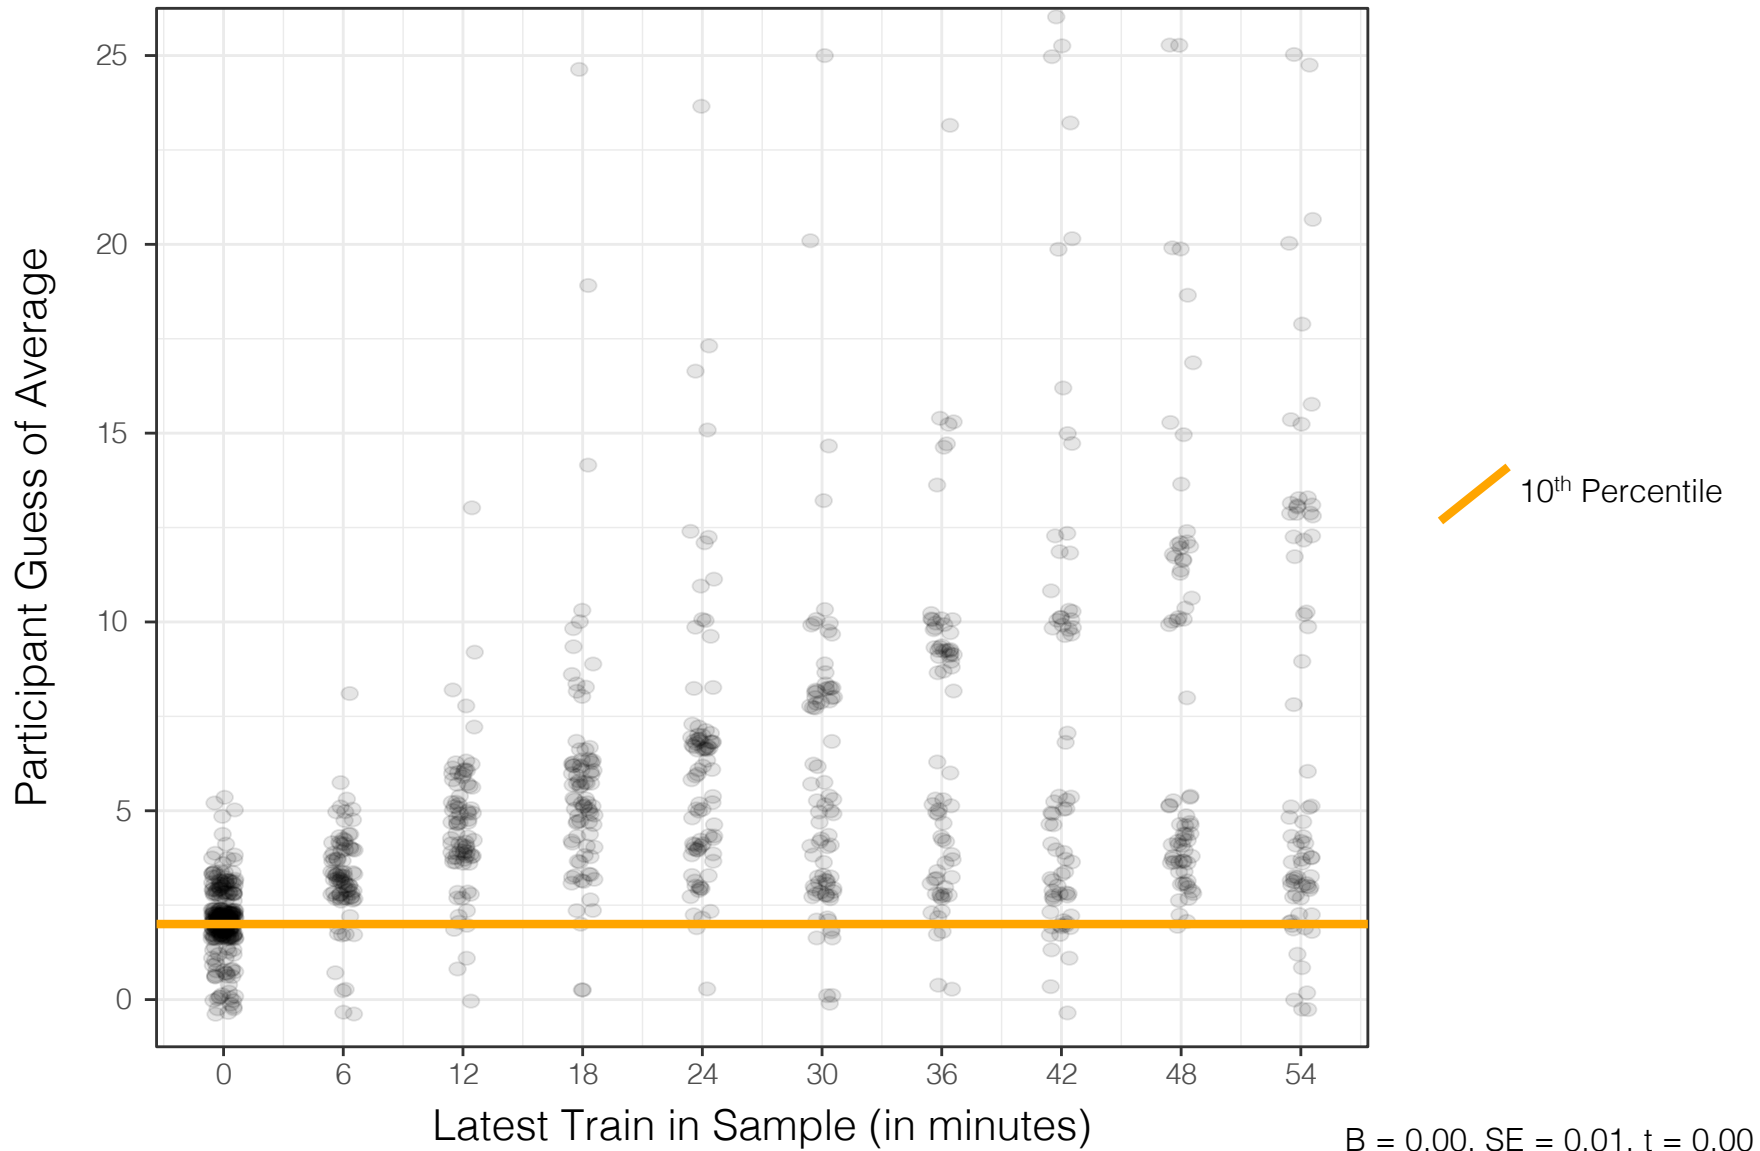

Do participants use the sample median to predict population mean?

Do participants use the sample median to predict population mean?

Do participants use the sample median to predict population mean?

summary

summary

- about 10% of participants give extra weight to outliers in a sample
- about 10% of participants also always ignore outliers

summary

- about 10% of participants give extra weight to outliers in a sample
- about 10% of participants also always ignore outliers
- On average, participants start to discount early, but don't discount completely

summary

- about 10% of participants give extra weight to outliers in a sample
- about 10% of participants also always ignore outliers
- On average, participants start to discount early, but don't discount completely

open questions

summary

- about 10% of participants give extra weight to outliers in a sample
- about 10% of participants also always ignore outliers
- On average, participants start to discount early, but don't discount completely

open questions

- other distributions?

summary

- about 10% of participants give extra weight to outliers in a sample
- about 10% of participants also always ignore outliers
- On average, participants start to discount early, but don't discount *enough*

open questions

- other distributions?
- individual differences in outlier appraisal?
