### Contingent Nudges: Influencing Decisions to Save and How Much to Save Wendy De La Rosa, Stanford University Itamar Simonson, Stanford University

# **RESEARCH QUESTION**

Does anchoring impact the both the decision to save and how much to save?

#### BACKGROUND

39% of consumers do not have \$400 to cover an emergency expense (Federal Reserve Board, 2019)

Saving anchors have been viewed as an effective nudge in increasing savings behavior, especially in a retirement context (Kusko, Poterba, & Wilcox, 1994)

Yet, research has not evaluated anchoring's impact on both the likelihood of saving and the average savings rate

### CONCLUSION

Consumer saving involves two key decisions: (1) whether to save, and if so, (2) how much to save

These two decisions are conceptually distinct and are differentially influenced

Anchoring does not impact consumers' primary decision to save

However, conditional on saving, anchoring impacts consumers' decision regarding how much to save

Changing the savings scale from increasing to decreasing can impact the likelihood of saving

# **STUDY 1: REAL WORLD SAVING**

Analyzed real tax saving behavior of 18,582 low-income Even users (personal finance app 3 conditions: (1) 20% anchor, (2) 30% anchor, and (3) 40% anchor
2 DVs: (1) Percentage of savers and (2) average savings rate

#### **Results:**

(1) Anchoring did not impact the likelihood of saving  $(\chi^{2}(2, N=18,852)=.68, p=0.713)$ (2) However, conditional on saving, anchoring does impact the average savings rate (F(2,10064))

## STUDY 2: LAB REPLI

Analyzed saving behavior of 389 Prolific Academic **5 conditions:** (1) 10% anchor, (2) 20% anchor, (3) anchor, and (5) 50% anchor

2 DVs: (1) Percentage of savers and (2) average sa

#### **Results:**

(1) Anchoring does not impact the likelihood of savir

(2) However, conditional on saving, anchoring does average savings rate (F(4, 308) = 8.41, p<.001)
