

Using value salience to facilitate effective donation decisions: A plan for two online experiments

Sille-Liis Männik & Andero Uusberg
Institute of Psychology, University of Tartu, Estonia

Abstract

People often prefer less effective charities due to biases, e.g. the identifiable victim effect (Caviola, Schubert & Greene, 2021).

Based on a framework we're developing, we hypothesize that such biases can be reduced by increasing the salience of relevant values like altruism and rationality.

To test that, we are designing two online experiments using the Prolific Academic platform.

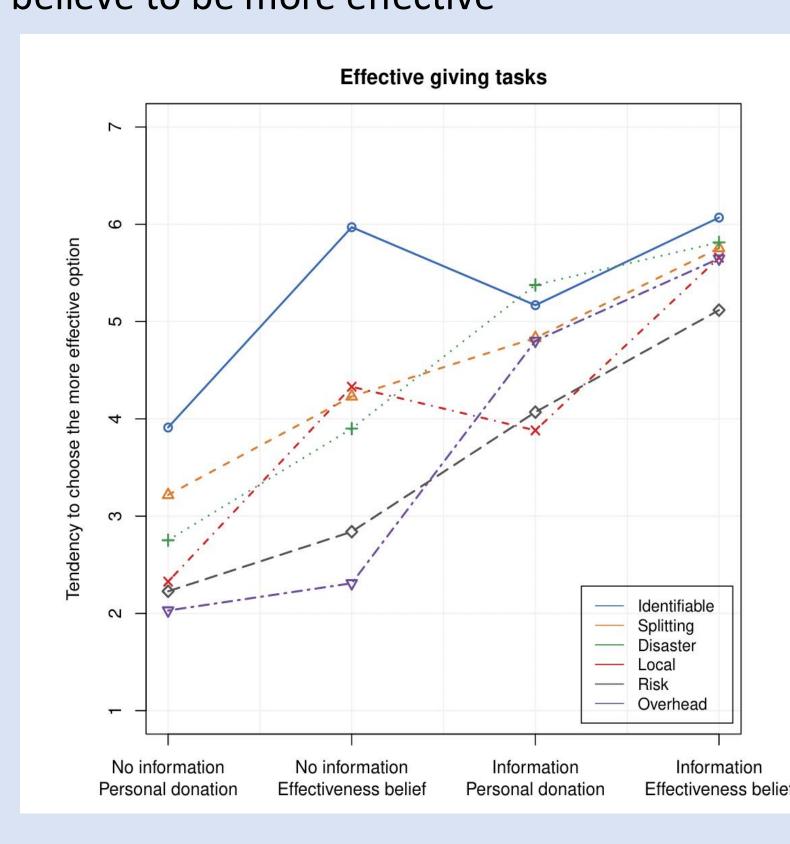

Introduction

The best charities can be several times more effective than average charities within the same area (Ord, 2013). People express a preference for effectiveness, but there's an intention-behavior gap (Caviola, Schubert & Nemirow, 2020).

We will use decisions scenarios from Caviola et al (2020):

- Identifiable victim vs statistical victims (see example on the right)
- 2. Local charity vs charity abroad
- 3. Low overhead vs high overhead charity
- 4. Risky but high expected-value vs lower expected value but certain charity
- 5. Disaster relief vs relief for ongoing issue
- 6. Splitting donation vs giving everything to one more effective choice

Donors were asked 1) where they would personally donate or 2) which option they believe to be more effective

Charity A

This is Benge. He is seven years old and lives in Kenya. When he grows up, he wants to become a teacher. Benge contracted HIV and needs to be flown to Europe to be treated in a hospital. Donating to Charity A will help save Benge's life and give him a bright future.

No photo used for Charity B

Charity B

Charity B distributes bed nets in Kenya to protect children against malaria-carrying mosquitos. Donating to Charity B will allow for the distribution of such bed nets in the areas that are most affected by malaria-carrying mosquitos.

Effectiveness information:

Before you respond, consider the following:
Scientists have shown that distributing bed
nets is one of the most cost-effective ways
to help people at risk of malaria, and one
of the most effective ways to help people
in this area in general. By contrast, treating
individual people who have contracted HIV
is much less effective. Therefore, Charity B
will likely save more lives with your
donation.

Research questions

- Does value salience influence preference for effective donation options?
- Do donors perceive a conflict between rationality and altruism when making donation decisions?
- How does the interaction of values and effectiveness information influence effective donation decisions?

Study design

(1)

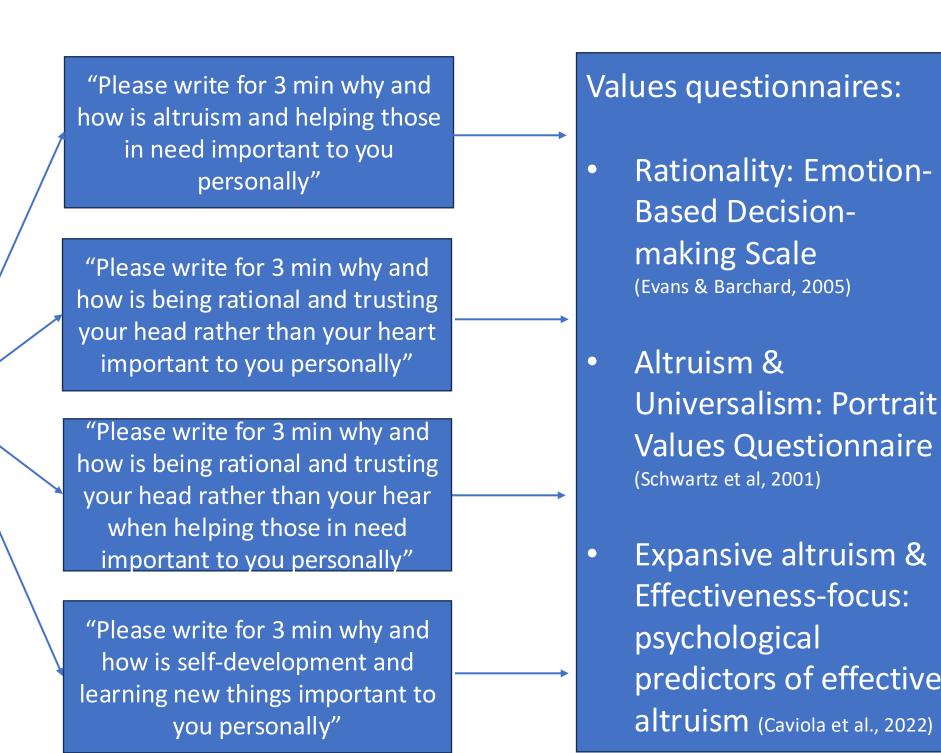

Manipulation check with 4 conditions: 1) Altruism 2) Rationality 3) Rational Altruism 4) Control

Values questionnaires: Rationality: Emotion-Based Decision-making Scale (Evans & Barchard, 2005) Altruism & Universalism: Portrait Values Questionnaire (Schwartz et al, 2001) Expansive altruism & Effectiveness-focus: psychological

predictors of effective

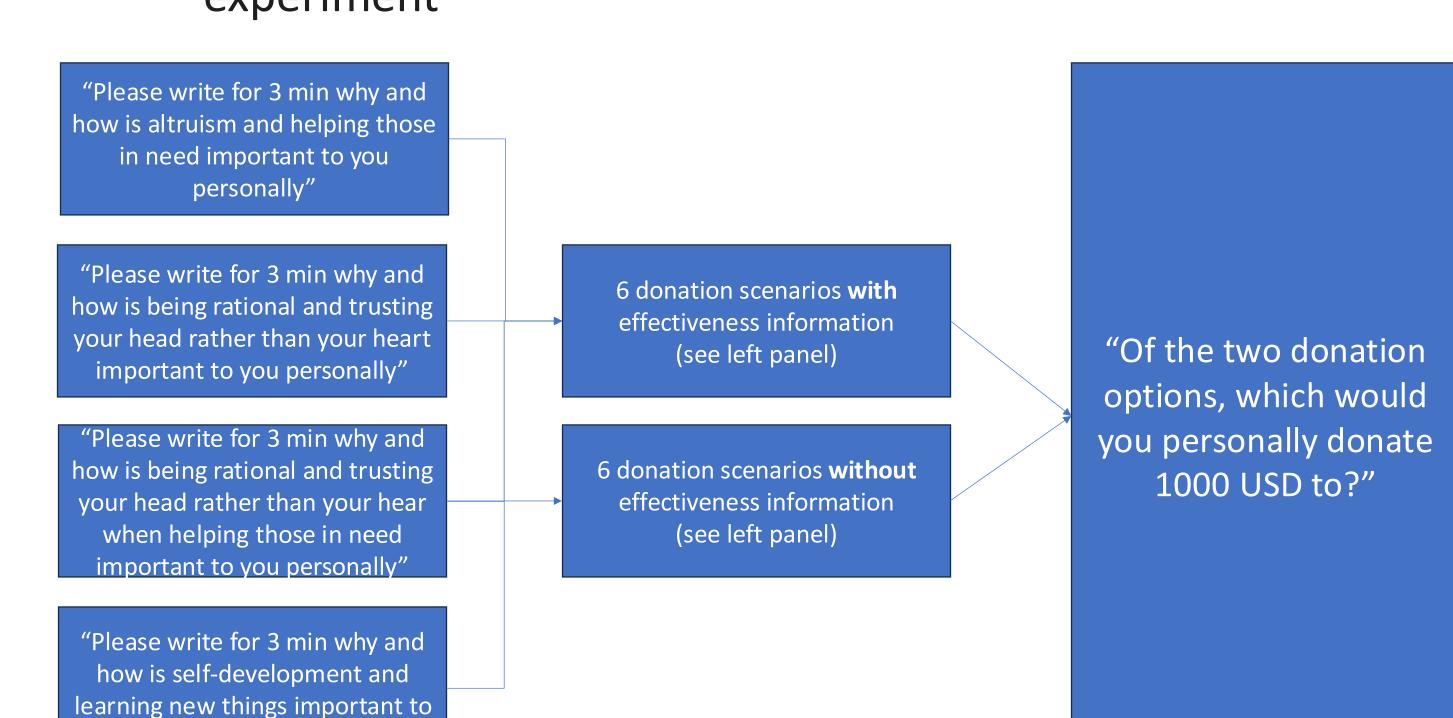

altruism (Caviola et al., 2022)

you personally"

2

4 values (altruism, rationality, rational altruism, control) x 2 effectiveness info (with, without) between-subjects experiment

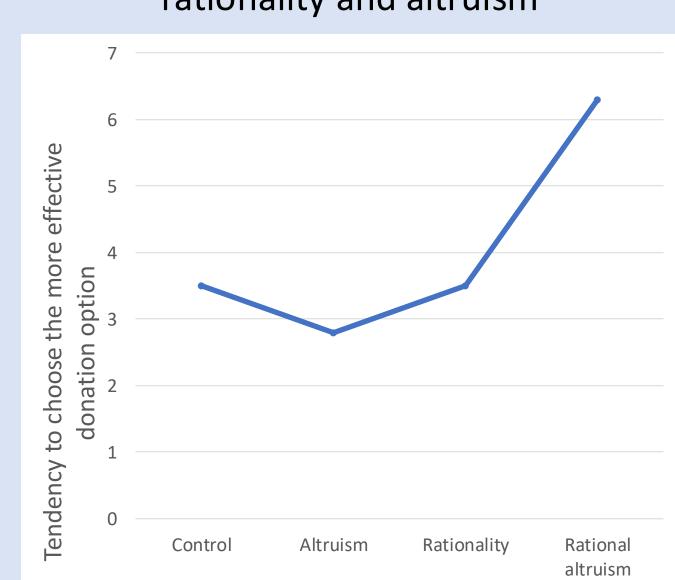

Interpreting results

To analyze the main research questions, we will run six mixed ANOVAs for each donation scenarios:

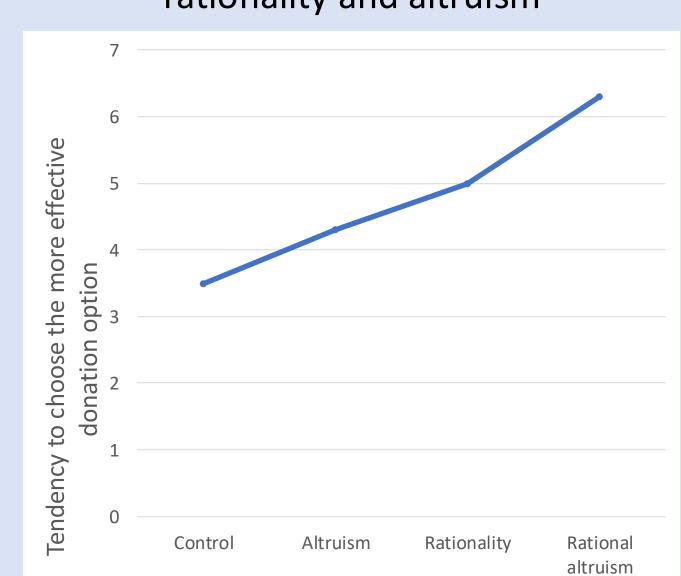

Y ~ writing task (4 levels) x effectiveness info (2 levels) + error

where Y is the preference to donate to the more effective option.

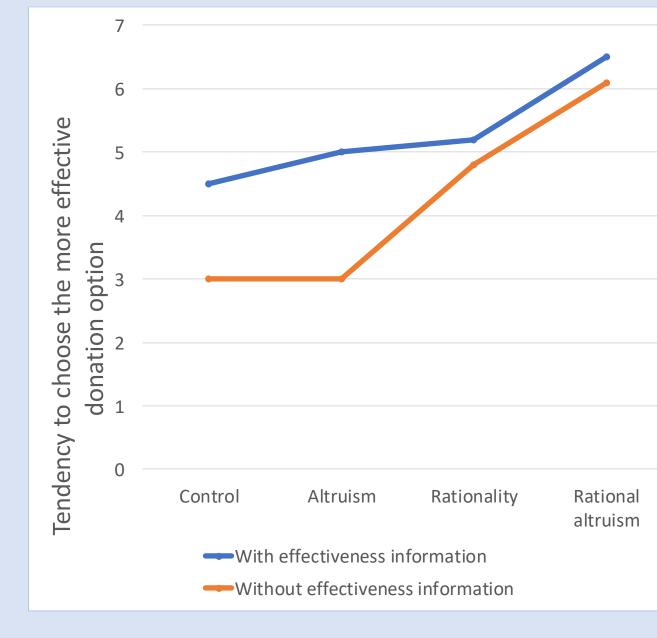

Expected results in the case donors perceive a conflict between rationality and altruism

Expected results in the case of no perceived conflict between rationality and altruism

Expected interaction between value salience and effectiveness information
